

# Transport

The below figure illustrates the indicative construction traffic route. We welcome feedback on the proposed route. The planning application will be supported by a Construction Traffic Management Plan which will confirm the most suitable construction traffic route, based on swept path analysis for the delivery vehicles of the equipment for the solar proposal.

The construction period is anticipated to cover around a one-year period. During this phase an average of 7 daily traffic movements to the site will be required for construction activities. There will be a temporary construction compound located on-site for parking and welfare facilities for the construction team.

Once the site is operational, light goods vehicles or 4x4 vehicles will access the site 1-2 times a month and will utilise the existing access track. Existing internal access tracks will be upgraded for use of the delivery vehicles.
